

*Announcing a new, two year project at NCEAS:*  
**Western Wildfire Resilience Index**

***You can't manage what you don't measure***

Wildfires are major ecological and social hazards across the North American West. Communities are working hard to be resilient to this growing threat, but ***how do we know when management is working?***

Built on the success of the NCEAS' Ocean Health Index, the Western Wildfire Resilience Index will provide policymakers and the public with clear, actionable metrics to improve management decisions.

***Join our growing interdisciplinary team***

Holistic assessments require expertise from across disciplines. For the pilot of this two year project we will be ***recruiting seven academic positions.***

We expect to hire two postdoctoral scholars, two data analysts, one project manager, one web developer/data visualization expert, and one science policy and communication specialist. For postdocs and project managers, experience with fire is desired, but is not required for other positions.
